

Solution Requirements

Date	26 June 2026
Team ID	XXXXXX
Project Name	Credit card Approval Prediction
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S. No	Requirement Category	Requirement Description	Priority
1	Authentication	Users can securely access the web application and submit applicant details for prediction.	High
2	Authorization levels	General users can access prediction features, while administrators can manage the trained model and application configuration.	Medium
3	External interfaces	The system interacts with the trained Machine Learning model and local data files for prediction.	High
4	Transactions processing	User input is validated, preprocessed, and sent to the prediction model to generate the approval result.	High
5	Reporting	The system displays the prediction result along with the confidence score on the result page.	Medium

6	Business rules, etc.	Prediction is performed only after all mandatory applicant details are entered and validated.	High
7	Compliance to laws or regulations	User information is processed securely and is not permanently stored, following basic data privacy practices.	Medium
8	Other	The application allows users to perform multiple predictions without restarting the system.	Low

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The system should generate prediction results quickly after form submission.	Prediction displayed within 2 seconds
2	Scalability	The application should support multiple prediction requests without performance degradation.	Supports 100+ simultaneous prediction requests
3	Security & Data Privacy	User input should be processed securely without permanently storing sensitive applicant information.	Secure processing with no persistent storage of user data
4	Reliability & Availability	The web application should remain available during normal operation with stable prediction functionality.	99% application availability
5	Usability & Accessibility	The interface should be responsive, easy to navigate, and user-friendly across modern devices and browsers.	Responsive design with intuitive user experience
6	Other	The application should be maintainable, allowing future updates to the ML model and UI without major code changes.	Modular project structure with easy maintainability
